Instruction01. Configuration of development environment

Creation and Administration of Cloud-based Applications

Wojciech Thomas

Fall 2026

1 Learning objectives

1. Configure the development environment for building containers using CloudFormation service.

2 Tasks

2.1 Task 1. Configure environment.

1. From Moodle download file `cacba2026.yaml`.
2. Log in to AWS Learner Lab environment, start the lab and open AWS Console.
3. In AWS Console open CloudFormation service.
4. Click “Create stack” button.
5. In page “Create stack” configure:
   - Prepare template: Choose an existing template.
   - Template source: Upload a template file
   - Click “Choose file” and select downloaded `cacba2026.yaml` file.
   - Click “Next” button
6. In page “Specify stack details” configure:
   - Stack name: CACBA2026
   - Parameters: you can adjust Disk Size to your needs - default size is 12GB
   - InstanceType: keep `t3.micro` (free tier - you don’t pay for it), until you need more powerful machine.
   - Click “Next” button
7. In page “Configure stack options” configure:
   - Stack deployment options / Express mode - check the box Enable.
   - Click “Next” button
8. In page “Review and create” configure:
   - Click “Submit” button
9. Wait, until in the “Stacks” sidebar you can see `CREATE_COMPLETE`.
10. In AWS Console, open EC2 service.

11. Open Instances section. Find the `devserver` instance. Check the checkbox next to `devserver`.
12. Click “Connect button” above.
13. In the page “Connect to Linux instance”, click “Connect” button.
14. Run command: `cat ~/.config/code-server/config.yaml`
15. Write down the displayed password. It should look like: `974cb0cd974560ed`
16. Get back to the list of EC2 instances. Select instance `devserver`.
17. At the bottom, in the “Details” tab, find “Public DNS” and copy the public DNS address. It should look similar to `ec2-1-2-3-4.compute-1.amazonaws.com`.
18. Open browser, and in the address bar type: `http://<public-DNS-address>:8080/` . It should look similar to:

    ```
    http://ec2-3-213-234-74.compute-1.amazonaws.com:8080/
    ```

19. In the PASSWORD field, paste your password and click Submit button. Soon you should see Visual Studio Code running inside your EC2.

Congratulations! You have your own developer server.

Warning: to keep the IP address of the instance the same, this configuration uses Elastic IP address - you will pay about $4 for this address.
